Agentic Software Engineering System- URL Shortener

Functional Requirements

A conventional URL-shortening platform, where correctness, latency, scale, redirects, abuse prevention, and analytics matter. An agentic interface/control plane, where an AI agent can understand goals, gather context, invoke tools, make bounded decisions, and manage links safely. In simple terms, build a reliable AI agent that understands a user's natural-language objective, reasons about it, selects the appropriate URL-shortener APIs, executes multi-step workflows, observes the results, recovers from failures, and safely completes the objective.

Non-Functional Requirements
